C; Comment: Thrombin, which cleaves bonds after Arg and Lys, converts fibrinogen to fibri
C; Comment: Prothrombin is activated on the surface of a phospholipid membrane that binds
ter 314-Arg, are released in natural blood clotting.
C; Comment: The cleavage after Arg·198, observed in vitro, does not occur in plasma.
C; Comment: The gamma-carboxyglutamyl residues bind calcium ions, result from the carboxyglutamyl charged phospholipid membrane surface.
C; Comment: The prothrombin precursor is synthesized in the liver.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        A; Molecule type: protein

                                                                                          -1 - GUBDIT: SYNTHESIZED AS A SINGLE CHAIN PRECURSOR, WHICH IS CLEAVED INTO A LIGHT CHAIN AND A HEAVY CHAIN HELD TOGETHER BY A DISULFIDE BOND. THE ENZYME IS THEN ACTIVATED BY THROMEIN, WHICH CLEAVES A TETRADECARPETIDE FROM THE AMINO END OF THE HEAVY CHAIN; THIS REACTION, WHICH OCCURS AT THE SURFACE OF ENDOTHELIAL CELLS, IS STRONGLE PROMOTED BY THROMEOMODILIN.

-1. PTH: TISSUE SPECIFICITY: PLASMA; SYNTHESIZED IN THE LIVER.

-1. PTH: THE VITAMIN K-DEPENDENT, ENZYMATIC CARBOXILATION OF SOME GLU RESIDUES ALLOWS THE MODIFIED PROFER TO CARDOXILATION OF SOME GLU RESIDUES ALLOWS THE MODIFIED PROFER TO CARDING THE SITE, BEYOND THE GLA DOMAIN. THIS GLA-INDEPENDENT BINDING SITE IS NECESSARY FOR THE RECOGNITION OF THE THROMEIN-THROMEOMODULIN COMPLEX.

-1. SIMILARITY: BELONGS TO PEPTITABSE FAMILY SI.

-1. SIMILARITY: CONTAINS 2 BGF-LIKE DOMAINS.

                                                                                                        "SUBUNIT: Synthesized as a single chain precursor, which is cleaved into a light chain and a heavy chain held together by a disulfide bond. The enzyme is then activated by thrombin, which cleaves a tetradecapeptide from the amino end of the heavy chain; this reaction, which occurs at the surface of endothelial cells, is strongly promoted by thrombomodulin.

-I TISSUE SPECIFICITY: Plasma; synthesized in the liver.
-I FPM: The vitamin K-dependent, enzymatic carboxylation of some Glu residues allows the modified protein to bind calcium.

-I MISCELAMBEOUS: Calcium also binds, with stronger affinity to another site, beyond the recognition of the thrombomodulin complex.
            Cell. Mol. Life Sci. 58:148-159(2001).
-!-FUNCTION: Protein C is a vitamin K-dependent serine protease that regulates blood coagulation by inactivating factors Va and VIIIa in the presence of calcium ions and phospholipids.
-!- CATALYTIC ACTIVITY: Degradation of blood coagulation factors Va
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Blood coagulation, Glycoprotein, Serine protease, Gamma-carboxyglutamic acid, Calcium-binding, Vitamin K; Hydroxylation, EGF-like domain; Repeat, Endothelial cell; Hydrolase, Signal.

THE BLYME IS THEN ACTIVATED BY THROMBIN, WHICH CLEAVES A TERADECAPEPTIDE FROM THE AMINO END OF THE HEAVY CHAIN; THIS REACTION, WHICH COCURS AT THE SURFACE OF ENDOTHELIAL CELLS, IS STRONGLY PROMOTED BY THROMBOMODULIN.

-!- SUBUNT: SYNTHESIZED AS A SINGLE CHAIN PRECURSOR, WHICH IS CLEAVED INTO A LIGHT CHAIN AND A HEAVY CHAIN HELD TOGETHER BY A DISULFIDE BOND. THE ENXXME IS THEN ACTIVATED BY THROMEIN, WHICH CLEAVES A TETRADECAPEPTIDE FROM THE AMINO END OF THE HEAVY CHAIN; THIS FRACTION, WHICH OCCURS AT THE SURFACE OF ENDOTHELIAL CELLS, IS STRONGLY PROMOTED BY THROMBOMODULIN.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           "Nucleotide structure and characterization of the murine gene encoding anticoagulant protein C.";

-1- FUNCTION: Factor Xa is a vitamin K-dependent glycoprotein that converts prothrombin to thrombin in the presence of factor Va, calcium and phospholipid during blood clotting.
-!- CATALYTIC ACTIVITY: Preferential cleavage: Arg-|-Thr and then Arg-|-Ile bonds in prothrombin to form thrombin.
-!- SUBDUNT: THE THO CHALMS ARE FORMED FROM A SINGLE-CHAIN PRECURSOR BY THE EXCISION OF TWO ARG RESIDUES AND ARE HELD TOGETHER BY I OR
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              STRUCTURE BY NMR OF 85-126.

           "An endoprotease homologous to the blood clotting factor X as a determinant of viral tropism in chick embryo.";

EMBO '0 9:4189-4195(1990).

-!- FUNCTION: Factor Xa is a vitamin K-dependent glycoprotein that converts prothrombin to thrombin in the presence of factor Va, calcium and phospholipid during blood clotting.

-!- FUNCTION: VAP CLEARES THE FUSION PROTEINS OF SENDAI VIRUS, NDV, SITE, AND PLAYS A KEY ROLE IN THE VIRAL SPREADING IN THE ALLANTOIC
                                                                                                                                                                                      -!- CATALVAIC ACTIVITY: Preferential cleavage: Arg-|-Thr and then Arg-|-ILe bonds in prothrombin to form thrombin.
-!- SUBUNIT: THE TWO CHAINS ARE FORMED FROM A SINGLE-CHAIN PRECURSOR BY THE EXCISION OF TWO ARG RESIDUES AND ARE HELD TOGETHER BY I OR
                                                                                                                                                                                                                                                                                                                                              -!- FTM: THE ACTIVATION PEPTIDE IS CLEAVED BY FACTOR IXA (IN THE INTRINSIC PATHWAY), OR BY FACTOR VIIA, (IN THE EXTRINSIC PATHWAY).
-!- SIMILARITY: BELONGS TO PEPTIDASE FAMILY SI.
-!- SIMILARITY: CONTAINS 2 EGF-LIKE DOMAINS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               PROSITE; PS00022; BGF_1; 1.

**C -1- FUNCTION: Factor Xa is a vitamin K-dependent glycoprotein that converts prothrombin to thrombin in the presence of factor Va, calcium and phospholipid during blood clotting.

**C -1- CATALYTIC ACTIVITY: Preferential cleavage: Arg-1-Thr and then Arg-1-ILe bonds in prothrombin to form thrombin.

**Arg-1-ILE bonds in prothrombin to form thrombin.

**INDINIT: THE TWO CHAINS ARE FORMED FROM A SINGLE-CHAIN PRECURSOR BY TWO ARG RESIDUES AND ARE HELD TOGETHER BY 1 OR WARD NATION OF TWO ANG RESIDUES AND ARE HELD TOGETHER BY 1 OR
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  -!- PTM: N- AND O-GLYCOSYLATED.
-!- PTM: THE ACTIVATION PEPTIDE IS CLEAVED BY FACTOR IXA (IN THE INTRINSIC PATHWAY), OR BY FACTOR VIIA (IN THE EXTRINSIC PATHWAY).
-!- SIMILARITY: BELONGS TO PEPTIDASE FAMILY SI.
-!- SIMILARITY: CONTAINS 2 EGF-LIKE DOMAINS.
                                                                                  X-RAY CRYSTALLOGRAPHY (2.2 ANGSTROMS) OF 86-179 AND 235-278.

Mutat. Suppl. 1:5189-5191(1998).

-1- FUNCTION: CIRCULATES IN THE BLOOD IN A ZYMOGEN FORM. FACTOR VII IS CONVERTED TO FACTOR VIIA BY FACTOR XA, FACTOR XIIA, FACTOR IXA, OR THROMEIN BY MINOR PROTEOLYSIS. IN THE PRESENCE OF TISSUE FACTOR AND CALCIUM IONS, FACTOR VIIA THEN CONVERTS FACTOR X TO FACTOR XA BY LIMITED PROTEOLYSIS. FACTOR VIIA WILL ALSO CONVERT FACTOR IX TO FACTOR IXA IN THE PRESENCE OF TISSUE FACTOR VIOLATION.
"Severe factor VII deficiency caused by mutations abolishing the cleavage site for activation and altering binding to tissue factor."; Blood 83:3524-3535(1994).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            "Factor VII Mie: homozygous asymptomatic type I deficiency caused by an amino acid substitution of His (CAC) for Arg(247) (CGC) in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                is a common, probably ancient mutation causing factor VII

Adv. Exp. Med. Biol. 281:121-131(1990).
IN THE BLOOD IN A ZYMOGEN FORM. FACTOR VII S.
CONVERTED TO FACTOR VIIA BY FACTOR XA, FACTOR XIA, FACTOR IXA, OR
AND CALCIUM IONS, FACTOR VIIA THEN CONVERTS FACTOR X TO FACTOR XA
BY LIMITED PROTEOLYSIS. FACTOR VIIA WILL ALSO CONVERT FACTOR X
FACTOR IXA IN THE PRESENCE OF TISSUE FACTOR AND CALCIUM.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        MEDLINE=89213999; PubMed=31446537;
